Remote Lift Maintenance

sigma4lifts is a remote maintenance solution, designed to optimise the performance of lifts.

sigma4lifts connects your lift with an intelligent platform that offers the following advantages:

▣ Improvement in the service life of the lift

sigma4lifts constantly monitors the functioning of the lift and allows anomalies to be detected, thus anticipating possible faults and lengthening the durability of its components.

▣ Increase in safety and operating quality

sigma4lifts immediately notifies the engineer responsible for the maintenance of the lift of any event or irregularity detected. Response times are thus reduced, safety increased and operating quality improved.

❖ **Diagnostics and remote supervision**

sigma4lifts can remotely analyse the operating history of the lift components and thus ensure optimum maintenance.

❖ **Integrated digital telephone line in accordance with Standard EN 81-28***

sigma4lifts provides a telephone line to the lift and automatically carries out regular checks for correct functioning, in accordance with Standard EN 81-28.*

(*) The harmonised Standard EN 81-28 complies with Directive 95/16/EC for alarm systems on lifts, and establishes the undertaking of an automatic test on the alarm system, as well as its connection with the reception equipment through to acknowledgement of reception, at least every 3 days.
